

ITGA6 gene

integrin subunit alpha 6

Normal Function

The *ITGA6* gene provides instructions for making one part (the $\alpha 6$ subunit) of two proteins known as $\alpha 6\beta 4$ integrin and $\alpha 6\beta 1$ integrin. Integrins are a group of proteins that regulate the attachment of cells to one another (cell-cell adhesion) and to the surrounding network of proteins and other molecules (cell-matrix adhesion). Integrins also transmit chemical signals that regulate cell growth and the activity of certain genes.

The $\alpha 6\beta 4$ integrin protein is found primarily in epithelial cells, which are cells that line the surfaces and cavities of the body. This protein plays a particularly important role in strengthening and stabilizing the skin. It is a component of hemidesmosomes, which are microscopic structures that anchor the outer layer of the skin (the epidermis) to underlying layers. As part of a complex network of proteins in hemidesmosomes, $\alpha 6\beta 4$ integrin helps to hold the layers of skin together.

The other integrin made with the $\alpha 6$ subunit, $\alpha 6\beta 1$ integrin, functions during the formation of organs and tissues before birth. The $\alpha 6\beta 1$ integrin protein has not been as well studied as $\alpha 6\beta 4$ integrin.

Health Conditions Related to Genetic Changes

epidermolysis bullosa with pyloric atresia

At least five mutations in the *ITGA6* gene have been found to cause epidermolysis bullosa with pyloric atresia (EB-PA). In addition to skin blistering, people with EB-PA are born with a life-threatening obstruction of the digestive tract called pyloric atresia. Mutations in the *ITGA6* gene account for about 5 percent of all cases of EB-PA.

The *ITGA6* gene mutations responsible for EB-PA lead to a loss of functional $\alpha 6\beta 4$ integrin. These mutations alter the normal structure and function of the $\alpha 6$ integrin subunit or prevent cells from producing enough of this subunit. The resulting shortage of functional $\alpha 6\beta 4$ integrin causes cells in the epidermis to be fragile and easily damaged. Friction or other minor trauma can cause the skin layers to separate, leading to the widespread formation of blisters. It is less clear how mutations in the *ITGA6* gene are related to pyloric atresia.

prostate cancer

cancers

Researchers believe that both $\alpha 6\beta 1$ integrin and $\alpha 6\beta 4$ integrin may play critical roles in the progression of cancerous tumors called carcinomas. These cancers arise in epithelial cells and can affect many tissues and organs, including the breast, lung, liver, prostate, and skin.

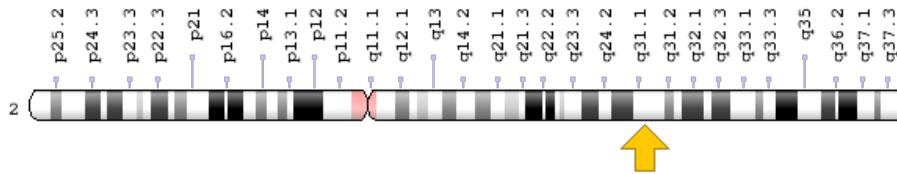

Changes in the location and activity of $\alpha 6\beta 1$ integrin and $\alpha 6\beta 4$ integrin within cancer cells are associated with the progression of carcinomas. The integrin proteins activate key signaling molecules, which trigger cancer cells to migrate through the body and invade other tissues. These signals also make cancer cells more resistant to self-destruction (apoptosis).

Recent studies suggest that, in addition to their roles in the progression of existing carcinomas, $\alpha 6\beta 1$ integrin and $\alpha 6\beta 4$ integrin may be involved in the initial formation of these tumors.

Chromosomal Location

Cytogenetic Location: 2q31.1, which is the long (q) arm of chromosome 2 at position 31.1

Molecular Location: base pairs 172,427,354 to 172,506,455 on chromosome 2 (Homo sapiens Annotation Release 108, GRCh38.p7) (NCBI)
